

. " However, there is no mention of the time code on a picture, but there is on a whole roll of film, which is why it is only useful to be used when film is used. Time-stamps and audio recording are also added to movies. "Take your Pulsar to school for a day" The most common use for the Time-to-Photograph stamp is for commemorative photos for life events such as a graduation, a birthday party, a wedding, a graduation party, or a photo documenting a lifelong friendship. The photographer may wish to record the date, time and location of the photo session. The owner of the photos will need to know what stamp was used in order to determine the age of the photos. Time-to-Photograph stamps also function for storing the date a photo was taken. Any new camera made after 1995 can be set to store the time on each photo. The user must manually set the time for each picture, or allow the camera to set the time automatically, which makes the camera's internal clock match the time set on the camera. Older cameras with a date or time stamp are set up by the user. Many cameras made after 1995 can store the date on each photo in their internal memory. Most can also store the time. There is software available that will set the time automatically when the pictures are taken.
